

HEATING

Our house is provided with "**NACHTSPEIGERGERÄTE**" for the heating.

These heaters are equipped with special stone elements that are heated by electricity at night and give them a warmth in the daytime. In Germany, the nightflow is significantly cheaper than the dayflow and this system is frequently applied.

It is important to check that the stoves (living room by the window) are 3 at the time of arrival. If not, you can turn the knob to 3.

The newer stoves (living / dining area and kitchen) have 2 knobs and operate independently of the room thermostat. There is also an on / off switch that you can turn on.

The next morning, turn the button back to 1.

The thermostat has **NO** influence on the night's warming!

The thermostat can already be set to the desired temperature upon arrival.

At night you can set the thermostat to 0 if you do not want heat, of course not for winter months.

In the living room, an infrared panel is installed. Simply plug the plug into the socket and in a little while it's really nice and warm. Do not forget to disconnect the plug from the wall when leaving the house, avoid unnecessary heating costs! Infrared panel heating, like all other forms of infrared heating, is 100% safe. The surface temperature of the infrared heat panel never exceeds 90 degrees Celsius, which means that there is no danger of direct combustion in contact.

The manager will put the stoves in the correct position (in principle 3) during the winter period the day before your arrival so that it is already pleasant when you arrive.

The only **downside** is: if the heaters are not heated at night, they do not give warmth during the daytime! Rotating the buttons does not help!
